PRODUCT CASE STUDY · D2C

Should Miraggio build an app?

Hi, I'm Swati, an Associate PM. I took one question through the full product lifecycle: vision, Figma screens, go-to-market, and how a PM works with engineering, ops and marketing.

Swipe →

Hypothesis-based, from public info

PM VISION

Every bag should feel like a considered gift

"Help shoppers choose a Miraggio bag with confidence, and make it personal enough to give."

The business problem (hypothesis)

- On marketplaces, Miraggio pays commission and does not own the customer
- Every brand gets the same product page, so finish and personalization are hidden
- Bags are bought rarely, so one marketplace sale may never become a repeat buyer

Why an app

Website can test the features. The app earns its place through repeat use: saved recipients and occasion reminders.

North star

Repeat orders on Miraggio-owned channels (website plus app).

Idea to iteration: 7 stages, one metric each

Dark chip = metric tracked at that stage

1	**Discover** Interview gift-buyers, read return reasons, map channel economics	**Gifting share of orders**
2	**Define** Pick the wedge, write PRDs, cut scope to 5 features	**Stories with acceptance criteria**
3	**Design** Wireframes to hi-fi Figma, test with 5 gift-buyers	**Task success rate in tests**
4	**Validate** Run engraving, fit tags and a waitlist on the website	**Attach rate, waitlist sign-ups**
5	**Build** Two-week sprints, one cross-platform codebase	**Sprint predictability, crash-free sessions**
6	**Launch** Soft launch to waitlist, then a gifting peak	**Install to first purchase**
7	**Iterate** Weekly review, A/B tests, backlog from usage	**Repeat orders, owned channels**

DEFINE

Three pillars, five features, a clear "not yet" list

Confidence

2D fit check and 360 view

Personalize

Engraving, gift note, curated charm pairings

Occasions

Saved recipients and reminders

v1 scope (P0)

- F1 Gift and engraving flow
- F2 360 view for top sellers
- F3 2D fit visualizer
- F4 Recipients and reminders
- F5 Table stakes: browse, search, checkout (UPI, card, COD), tracking

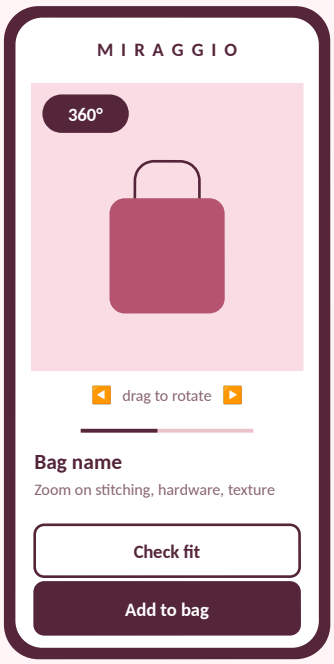

Not yet

Full 3D, outfit-upload AI, deep discounts, full charm builder

Decision gate

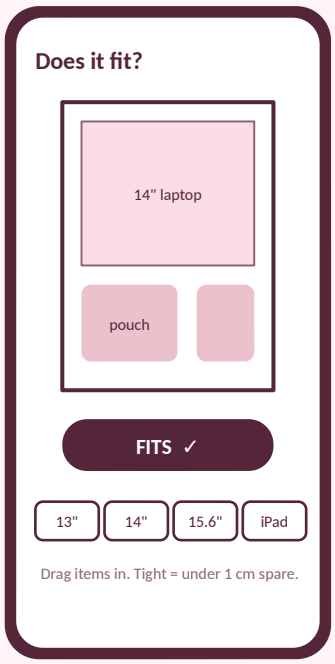

Build only if website tests show repeat intent. Else: PWA plus WhatsApp CRM.

From doubt to confidence

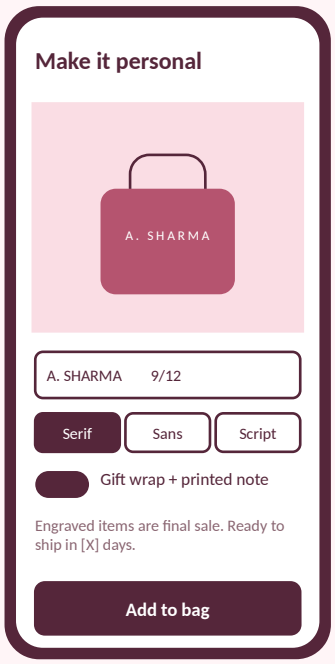

360 view

Spin and zoom on material and hardware

2D fit check

Drag items in. Fits, Tight or No.

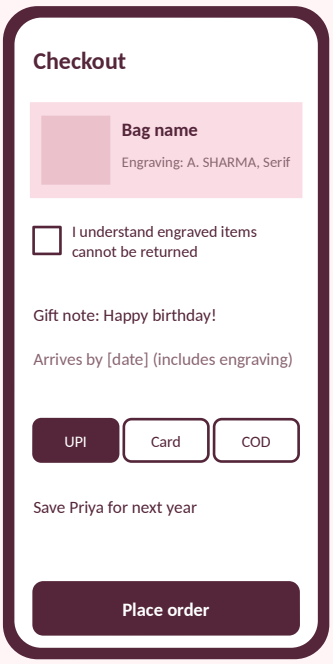

Engraving

Live preview, fonts, gift wrap, final-sale notice

Metrics on these screens

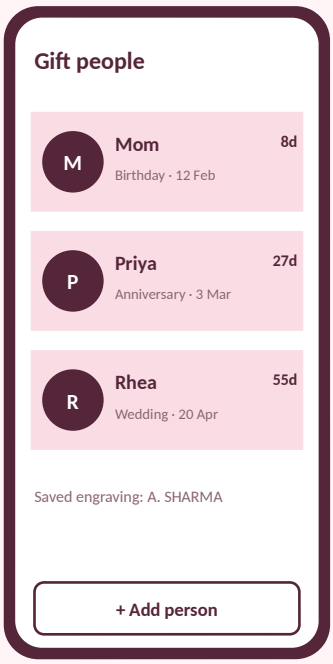

360 interaction rate and page speed. Fit tool usage, conversion lift, fit-related returns. Engraving attach rate and errors per 1,000.

From one gift to repeat visits

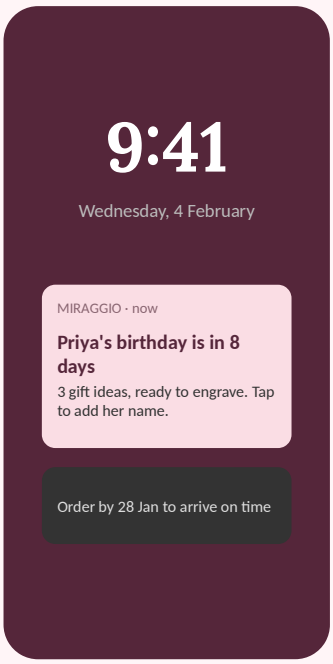

Gift checkout

Engraving summary, return notice, delivery date

Gift people

Saved recipients, dates, past engraving text

Reminder

Push 8 days ahead, early enough to engrave and ship

Metrics on these screens

Checkout conversion and final-sale confirmation. Recipients saved per buyer. Reminder open rate and reminder-to-purchase rate.

USER JOURNEY

The flow, with the metric at every step

Dark chip = metric tracked at that step

1	**Discover** Packaging QR, WhatsApp, Instagram	**Install rate**
2	**Onboard** Phone OTP, notification opt-in	**OTP completion**
3	**Browse and spin** 360 view, zoom on material	**360 interaction rate**
4	**Fit check** Does my 14" laptop fit?	**Fit tool usage**
5	**Personalize** Engraving, charm, gift note	**Engraving attach rate**
6	**Checkout** UPI, card or COD, delivery date	**Checkout conversion**
7	**Save recipient** Dates and past engraving text	**Recipients saved per buyer**
8	**Reminder, repeat** Push 8 days before the date	**Reminder-to-purchase**

How the 2D fit tool actually gets built

Dark chip = who owns the step

1. **Define the fit rule**
   Fits, Tight, No. Spare margin, item list, acceptance criteria
   PM

2. **Measure the bags**
   Capture internal dimensions for top 20 bags, QA the data
   Catalog / Ops

3. **Design item library**
   To-scale laptops, iPad, pouch, charger, bottle
   Design

4. **Build**
   Renderer, drag and snap, fit engine, dimensions API
   Engineering

5. **Verify**
   Physically test 10 bags against the tool output
   QA

6. **Measure impact**

Metrics

Tool usage rate, conversion lift, fit-related returns, label mismatch rate.

Engraving, charms and gift curation across teams

Dark chip = who owns the step

1	**Spec the gift flow** Character limits, fonts, preview, final-sale rules	PM
2	**Engraving process** Vendor or in-house, turnaround, QC checklist, errors	Operations
3	**Order data** Exact text, font and placement sent to production	Engineering
4	**Charm pairings** Pick 1 to 2 bundles by sell-through, then expand	Merchandising + PM
5	**Gift curation** Sets by occasion and budget, content, creator posts	Marketing
6	**Reminders** Copy, timing, frequency caps	CRM + PM
7	**Weekly review** Attach rate, errors per 1,000, complaints, set revenue	PM

Launch with perks, not discounts

Dark chip = metric for the phase

1 Pre-launch (now)

Waitlist banner and Remind-me-next-year on the website, 6 to 8 gift-buyer interviews

Waitlist sign-ups

2 Soft launch

Waitlist and existing site customers, fix issues, test repeat intent

D30 repeat, crash-free sessions

3 Public launch

Before a gifting peak: packaging QR, WhatsApp, Instagram, creators, app-only gift sets

Own-channel order share

4 Retention

Occasion reminders, early access to drops, referral perk

Reminder-to-purchase, repeat rate

Principles

Perks marketplaces cannot copy (engraving, gift sets, early access). [VERIFY] marketplace rules on off-platform messaging first.

METRICS

One north star, inputs, and guardrails

North star

Repeat orders on Miraggio-owned channels

Acquire

- Installs
- Install to first purchase
- Own-channel share

Convert

- Fit tool usage
- Engraving attach
- Checkout conversion

Retain

- Recipients saved
- Reminder to purchase
- D30 and D90 repeat

Guardrails

Engraving errors and complaints. Returns on engraved items. Marketplace sales. Page and app speed. Notification opt-outs.

RISKS

What could go wrong, and my plan

1

Low app adoption

Low-frequency category

Phase 0 gate, reminders as repeat engine

2

Engraving errors

Items cannot be resold

Preview, confirm step, QC before dispatch

3

Wrong dimension data

A wrong Fits means a return

Verify bags before enabling the tool

4

Marketplace friction

Commission is also reach

Keep marketplaces, watch sales

Next 30 days

1. Confirm facts marked VERIFY. 2. Run website tests and interviews. 3. Collect dimensions for top 20 bags. 4. Go or no-go at the gate.

What would you add?

If you work on D2C products, I would love your take: would you build the app, or stay on mobile web and WhatsApp?
